WEEK 4: REFLECTION

Through this lesson, I learned how to use JavaScript to enhance interactivity and responsiveness based on user actions. I explored features such as displaying the current time, implementing dark and light mode switching, adding and removing tasks, responding to key events, and displaying a modal upon form submission. I also gained knowledge of local storage and DOM manipulation, and understood how HTML, CSS, and JavaScript work together to create a complete and visually appealing webpage.The challenges I encountered included organizing the semantic structure, properly arranging features, and designing a circular theme switch button with an icon while maintaining its functionality. I also experienced difficulty in modifying JavaScript without disrupting the HTML, CSS, and overall design. I addressed these issues by thoroughly testing the webpage and making gradual adjustments to the code and layout until I achieved a functional and user-friendly result. One key improvement I made was redesigning the theme switch button into a clean, circular icon button that retained its full functionality.
