WEEK 7: REFLECTION

I learned how to use Node.js to create the backend of a web application. At first, I was not familiar with Node.js, Express, and MongoDB, but through the activities I gradually understood how they work together to run a website. I also learned how to deploy a project online using Render, which helped me see how a website works behind the scenes.The challenges I encountered were setting up Node.js, creating the proper project structure, connecting to the database, and deploying to Render.

These were difficult because there were many steps to follow and one small error could break the whole project. I also got confused about where to place files and how to connect them properly.I solved these problems by carefully following instructions, checking my work step by step, and reviewing my code whenever errors appeared instead of giving up. Eventually, I was able to make the project work. This improved my understanding of how frontend, backend, and database communicate.In conclusion, this experience taught me that making a project work takes patience, planning, and willingness to try different solutions. I learned to stay calm, test small parts one by one, and keep track of changes, which made difficult tasks more manageable
