WEEK 6: REFLECTION

I learned about Client-Side Storage and API Integration with JavaScript. I gained experience in using Local Storage and Session Storage to store user data, fetching real-time weather information, displaying map locations, and retrieving public user data through the GitHub API. I also learned how JavaScript can integrate these features to create a dynamic and interactive webpage.The main challenge I faced was combining all the features into a single, well-structured and organized webpage while ensuring that the APIs and storage functions worked seamlessly with the design. I overcame this by developing each feature step by step, testing it in the browser, and refining the layout and code multiple times to ensure proper organization and functionality. As an improvement, I organized the webpage by clearly separating its sections, making the layout more understandable and user-friendly
